

Problem

Trie is an efficient information retrieval data structure. Use this data structure to store Strings and search strings. Your task is to use TRIE data structure and search the given string A. If found print 1 else 0.

Input Format

N=8 key[]={the,a,there,answer,any,by,bye,their} search=the

Constraints

Expected Time Complexity: $O(M+|search|)$. Expected Auxiliary Space: $O(M)$. M = sum of the length of all strings which is present in the key[]

|search| denotes the length of the string search

$1 \leq N \leq 104$ $1 \leq |input\ strings|, |A| \leq 100$

Language

Python 3

```
1 # Enter your code here. Read input from STDIN. Print
2 class TrieNode:
3     def __init__(self):
4         self.children = {}
5         self.is_end = False
6
7
8 class Trie:
9     def __init__(self):
10         self.root = TrieNode()
11
12     def insert(self, word):
13         node = self.root
14
15         for ch in word:
16             if ch not in node.children:
17                 node.children[ch] = TrieNode()
18             node = node.children[ch]
19
20         node.is_end = True
21
22
```
